Branch:Business Administration

Code: CMAMBA
Option: Computer Management-MBA
Level: Master
Prerequisites:
Opportunities;
IT PROJECT MANAGER
The IT project manager is responsible for the supervision of IT projects and is always aware of their current status. He can intervene on a specialist basis if necessary. He determines the project processes in the IT area as far as possible and can create specifications and guidelines himself, which can even simplify the subsequent course of the project. In doing so, he takes into account the company's needs and creates documentation during the project. Consultation with specialist departments and project managers is also part of his job. SCRUM MASTER
Agile work is becoming more and more important, and Scrum is often used as a method for monitoring numerous projects. The Scrum Master keeps an eye on the big picture, facilitating meetings such as daily scrum or the usually bi-monthly review and planning meetings. He designs the retrospectives at the end of a sprint, where the team reviews the processes again and optimizes them further. In addition to the technical know-how of Scrum, the Scrum Master needs to be an active listener with a lot of empathy, diplomacy, life experience and organizational skills.
HUMAN RESOURCES SPECIALIST: TECHNOLOGY RECURRENCE

Whereas the traditional recruiter was primarily concerned with advertising jobs and the subsequent management and screening of candidates, today's technology recruiters, in particular, must be involved in active recruitment and outreach as well as proactive talent acquisition. This includes networking by participating in job fairs and building talent pools, but also, of course, formulating and publishing job offers and screening candidates.

Description:
During your studies you will learn about IT concepts, modern IT services, project management and software development.

Specific competences:
You know how to survive in today's market. Terms like big data, artificial intelligence, cloud computing, IT security and data protection are buzzwords for you, not foreign words. You have already completed your studies and gained your first professional experience. Now you want to go further by acquiring IT expertise and management skills. The MBA IT Management prepares you for more important tasks.

Quality and competences:
Your soft skills and leadership qualities are emphasized. With this solid foundation, the MBA in IT Management will allow you to develop personally and expand your career opportunities.
